

MIL - SAN

the scientific contraceptive

MIL-SAN is a jelly, of which the formula is based on biological principles favourable to a healthy flora, and in harmony with the natural chemical and bactericidal balance of the vagina.

Its action is due to

- (a) a low p^H which ensures the immediate immobilization and death of spermatozoa despite the buffering action of the seminal secretion.
- (b) a low surface tension which permits it to spread readily and to penetrate every fold and fissure of the vaginal and cervical mucous membrane.
- (c) a sufficient degree of viscosity to ensure that it shall adhere to the cervix and upper vaginal tract, thus forming a chemical barrier against the penetration of spermatozoa to the ostium externum.

MIL-SAN contains no poison; is non-greasy; does not stain and acts immediately. There is no waiting time between application and effectiveness. Even under conditions of most frequent use, no ill effects need be feared, for owing to its biological characteristics it is not only a reliable contraceptive, but also a prophylactic against bacterial infection.

MIL-SAN is stable and keeps indefinitely in all climates. In manufacture, packing and method of use, all contact with metal is avoided and there is therefore no danger of contamination with metallic salts. The method of use is simple and hygienic and designed to avoid damage to the vaginal flora. Whilst the jelly minimizes the danger of abrasion, its presence is unnoticeable.

MIL-SAN is the most perfect contraceptive that present knowledge can devise. It has been offered to the medical profession only after most rigorous laboratory and clinical tests extending over five years carried out by practising gynaecologists and bacteriologists.

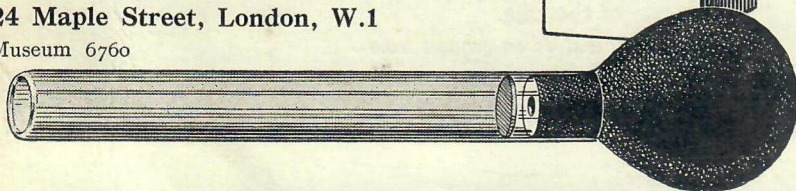

MIL-SAN is supplied in bottles containing twelve doses with bulb and glass syringe applicator; and ready for use in boxes containing 12 Ready Filled Single Application Tubes. The single application tubes obviate filling and subsequent cleaning which some people find troublesome.

Medical men are invited to request particulars of the formula and of the tests and experiments carried out.
