NEWARK, N. J.
U. S. A.

PATENTEX is a jelly-like preparation of recognized value in feminine hygiene. Being the original of the type of product now so popular with the medical profession, it continues to stand out, after a period of almost a quarter of a century, because of its distinctive composition and absolute dependability.

Composition: PATENTEX contains as its active ingredients, normal oxyquinoline sulphate, acid boric and liquid aluminum acetate tartrate in a scientifically developed, unusually effective colloidal base to which the name of "SEROL" has been given.

The vehicle SEROL is—analogueous to milk serum—synthetically built from water-suspended colloids and is isotonic to the human tissue fluids. SEROL, containing no grease, is readily soluble in water and mucus. It is neutral and soothing and is free from objectionable color or odor.

SEROL offers a unique advantage in presenting the active therapeutic principle, for rapid and thorough action on the membranes, in both molecular and colloidal dispersion.

Action: PATENTEX, upon being applied, intimately admixes with the vaginal mucus. Due to its extraordinary surface activity, it spreads widely over all the folds and crevices of the vaginal vault and thus produces a complete mechanical protection. Besides, its chemical agents thoroughly clean and deodorize the vaginal tract which is given a mild yet effective antiseptis.

PATENTEX, in feminine hygiene, is superior to the old-fashioned method of irrigation because, once applied, it adheres to the tissues whereupon it may exercise its beneficial action for hours.

PATENTEX allays irritation and inflammation. In case of morbid disturbances of the generative organs, such as vaginal catarrh, ulceration and discharges, and particularly in leucorrhoea, it serves as an actual therapeutic agent.

Properties: PATENTEX is a semi-liquid, non-greasy substance which is slightly scented and shows a pale yellowish-green tint. It does not stain the clothing nor skin.

PATENTEX is non-poisonous and non-irritating to the tissues. It is thermostable and always of even liquidity. It remains potent and of even consistency for several years.

PATENTEX is packaged in collapsible tubes and applied by means of a glass nozzle. It is economical—one tube containing about forty applications. It is clean and easy to handle and may be applied easily and without the use of any instrument.

History: PATENTEX was developed in Germany by a renowned chemist 24 years ago. It is based in two German patents and has been tested for its chemical and physiological reactions, by noted public and private laboratories.

The record of PATENTEX extends over a full generation of users. It is now pre-
