: CONTROL :
AND
: SPACING :
OF
CHILDBIRTH
BY
DR. H. MULLER.

P R E F A C E.

For some time modern humanity has felt the need for a Contraceptive of simpler type and capable of application in cases where the rubber cap pessary and the sheath were inappropriate and inadequate. This need has been voiced both by leaders of the medical profession and by workers in the birth control cause, and by the daily increasing number of people who use contraceptives, as a matter of course, and as part of their duty. In studying and advising on the practical side of birth control one is met again and again with cases where neither the "caps" nor the protective sheath meet the difficulty. It may be suggested that a liquid or jellified substance in the nature of ointment or paste, is the Ideal form of Contraceptive, especially if it can combine antiseptic, tonic and astringent action in the internal tissues with the power of plasmolising the sperm-cells, and can be applied in the handy and convenient manner made possible by the tube and nozzle appliance "Patentex".

Science has made it possible to build up (synthesise) foods, liquids, drugs, anaesthetics, useful, durable and sometimes beautiful substances for fabrics and constructional work. Science has of recent years been applied to the investigation of the genesis of life and the determination of sex; and in medicine and surgery marvels have been achieved in the correcting of accident or nature. It is amusing, though somewhat ironical, to observe some good persons whose natural defective teeth have long ago been replaced by hygienic and comely artificial dentures, whose defective eyesight is helped out by glasses with power lenses — constantly worn in some cases; whose appendices have been removed — inveighing with indignation and disgust against the "Unnaturalness" of birth Control.

Imagine the anger and contempt and ridicule that would sweep away advocates of e.g., stopping the use of X-Rays in the treatment of disease, prohibiting wireless experimentation, and the use of electricity? These triumphs of Mind over Matter have not only gripped the human imagination, but they have proved their usefulness again and again. Birth Control is not less wonderful and not less helpful.

"Patentex" ought to repeat in England the success it has undoubtedly had in many other countries. We cannot have too much knowledge of what concerns all of us so much; we cannot have too much power to decide and choose for ourselves in a region where most of us are so helpless and so blind.

Also Dr. Norman Haire, London, has closely applied himself to the examination of paste-like contraceptive expedients and, which is proved by his works, has met with best success. At the Sexual-Congress in Copenhagen in 1928,
Congress of Birth-Control in Berlin in 1928,
Sexual-Congress in London in 1929,

at reports and discussions of famous searchers and medical authorities Patentex has been qualified as the best product of that kind. Dr. Magnus Hirschfeld, Prof. Dr. Friedenthal, Prof. Rosenthal, Dr. Hodann, Dr. Werner and many others constantly use and recommend this excellent conception preventative to their utmost satisfaction. The experiences are deposited in scientific works.

"Patentex" — this neat compact little appliance, without unnecessary ornament or parade, — has helped many hundred thousands people, to face the future without gnawing anxiety, misery or despair, to do their duty to their children, to keep their health and the happiness of their homes and love-life.

Whenever Patentex is bought and used it will be found efficacious. The price at which it is sold compares very favourably with the price of any other contraceptive now on the market, when it is considered that each tube contains enough of the jelly to serve on about forty occasions. Some care and intelligence is necessary in the use of "Patentex": NOTHING IS FOOL PROOF. "Patentex" has the advantage, that it can be used immediately before the act of intercourse, instead of having to be adjusted like the sheath, at the last moment and under conditions which distract the attention and strain the nerve control. It acts for the next hours as a sure safeguard against conception.

Also "Patentex" can be used by the woman without a previous "fitting" like a cap pessary.

Further particulars of "Patentex" can be found in the text of the pamphlet, the chemical analyses, and professional opinions and the testimonials of those who have benefited by its use. May it do as much to help our people and to make life less difficult and more satisfying for the great majority who do the world's work.

THE CONTROL and SPACING of CHILDBIRTH

By Dr. H. MULLER.

The quality of mankind is, of necessity, improved by the fall in the number of children. Hence, not only economists, but also the hygienists and politicians must regard the improvement of the race (Quality) as of more importance than a mere increase (Quantity), because not only do wealth and power increase, where better taste and a higher standard of living are demanded, but the health of the people is invigorated, and finally the interests of the State are better served with strong and healthy citizens than with weaklings and cripples. The decline in Births does not therefore signify "Race-suicide" but "Race-improvement". There are numerous cases where from a medical standpoint the avoidance of pregnancy is not only desirable, but absolutely imperative, owing to the great danger to the health and life of the mother. In the case of parents who are afflicted with tuberculosis, kidney disease, alcoholism, neurasthenia, etc., every Doctor will often feel that he ought to bring home to such parents the grave responsibility they are taking upon themselves in having children who are stamped with weakness and degeneration even before they are born. It is his duty to do so, not only in the interests of those pitiable families, but still more in the general interests of Society. Such a conscientious medical adviser ought, however, to have in his hands a safe method which will not injure the health of the parents, but which will be capable of eliminating beforehand diseased offspring, and thus avoid the endless misery and suffering caused by such marriages.

When, as the author has seen, a mother, who was already weak before her marriage, after seven years of married life, and after the birth and suckling of five still poorly-developed children, had become a pale, anaemic weak-nerved woman, who was hardly able to fulfil her duties of wife and mother, what is the position with regard to the welfare of those brought into life, and the well-being of the loving and hardworking husband, who fortunately is healthy? And what will be the physical and mental constitution of the children, perhaps conceived and expected with fear and dread? Will they be grateful to those who brought them into existence? Is not the happiness of the whole family threatened?

Use the following label: Page-Header
The following is a letter I came across in Miller's book "The Escape From Sex Thralldom". This pitiable victim of her marital duty writes the following: —

"My first rude awakening to the bitter reality of married life came with the birth of my first child. My Doctor was of opinion that my bodily build was not suitable for child-bearing; the child had to be taken away and was dead. A year later I had again to go through the same suffering, and from being a light-hearted, cheerful girl, I became a sickly, nervous and excitable woman. Can it be wondered, in consequence, that I shrank from the embraces of my husband and regarded them as a horrible peril to my life? I made up my mind that I would have no more children, whatever the cost might be. Nevertheless, in the third year of my married life, I found I was again pregnant. When I discovered this, I was distracted. I went straight out of my house and ran along the streets to a doctor, of whom I had been told that he was not very scrupulous in such matters. I remember distinctly how people stared at me as I ran along, and they certainly must have thought me mad. I begged the doctor to do something to save me, even if it should cost me my life. After several attempts to dissuade me he fell in with my wishes, and carried out an operation.... Then I staggered home, looking like a ghost. I have a faint recollection of putting a few things into a travelling-bag, that a stranger helped me into a train, and that, pale as death, I reached my mother's house. After what had happened I could not return to my husband. His enquiries, the persuasion of friends, the fear of scandal, all met with a deaf ear on my part. I had rescued a shattered existence from a deathbringing treadmill and could not bring myself to resume such a life."

This letter speaks volumes about destroyed human happiness and certainly requires no comment.

By a wise and optional restriction of the number of children every fertile married couple will have children, and this will ensure a healthy and strong rising generation. In this way, every family under the advice of a Doctor will only have the number of children compatible with their present social circumstances. The wise restriction of the number of legitimate children on economic and especially on hygienic grounds, cannot be opposed. What ought to be fought is the increase of illegitimate births, so long as the State does not see to the bringing up of the children and the moral and physical welfare of the mothers. Previous experience has shown that illegitimate children, owing to bad nourishment

and upbringing, are inferior in every way to legitimate children. Furthermore, the fight must be waged against infant mortality, criminal abortion and sexual diseases. Thus, with birth-control and a continual excess of births, a strong future generation is to be looked for.

A prohibition of contraceptive methods will not only increase the number of illegitimate children in an undesirable manner, as owing to their inferiority they would be of little use to society, but general morality would be extremely endangered. The children born out of wedlock are not included in this category.

Under the difficult conditions of living, one must reckon more than ever that many young people get married comparatively late in life. Consequently, especially in large towns, there is a considerable amount of illicit intercourse, which is very difficult to estimate in figures. The use of protective methods which are dangerous to health should be made punishable. It follows that the prescription and recommendation of contraceptives which are certain in action, healthful and nonirritating, can, in the hands of a doctor, only conduce to the benefit of the family. The author is of opinion that the majority of medical men and especially the authorities hold these views, and that no injury will be done to public morality.

The right choice of a suitable method should not offer any difficulty to the carefully discriminating doctor. In the case of women suffering from kidney and heart diseases, constant abortions and similar ailments, I myself for many years have recommended only the PATENTEX safety appliance, and have been able, without exception, to secure beneficial results.

Where a man is afraid of having unhealthy or weak children, or worst of all too many children, whom he is unable to feed or clothe and educate properly, owing to his economic position or health, should advice be withheld from him by the Doctor? The advice that would enable him to enjoy life fully, and secure his conjugal happiness. Or ought we to preach to him continence in love, which only very exceptional individuals are able to practise? Will not rather every sympathetic medical adviser concur in my view, that by suggesting a harmless method a great boon may be conferred on him?

**EXTRACT from LEAFLET
on CONTRACEPTIVES in GENERAL.
PATENTEX in PARTICULAR.**

Professor of University **HANS FRIEDENTHAL, M. D.**

Synthetic chemistry has now solved the formerly insuperable problem of composing an adequate contraceptive, thanks to our present knowledge of the reproductive process. Both spermatozoa and the special micro-organisms which cause venereal diseases are extremely sensitive, both to all precipitants of albumen and to the majority of disinfectants, so we have succeeded in combining a precipitant with a non-toxic disinfectant in such proportions as to compose an effectual contraceptive. Sperms can only advance towards their goal through a weak alkaloid medium, while the slightest trace of acid deprives them of the power of motion and of penetration into the organs where the ovum is ready to receive them. The preparation Patentex, which is protected by patent, attains its object through the combination of an albumen precipitant and a disinfectant on a soluble basis which blends with the internal secretions, and the medical profession should take the opportunity of winning the gratitude of countless families by introducing this contraceptive to their notice. After personal investigations the writer of this article can recommend Patentex as both much safer and much more satisfactory than the usual rubber specialities, which frequently cause difficulties in both men and women—which chemical methods like Patentex cannot do. The method of application is so cleanly and safe that subsequent douching of the vagina is not necessary.

There is no paradox in the fact that a contraceptive like Patentex is to be recommended, not only by those who believe us to be suffering from over population, but also by those robust optimists who hold that for the sound and healthy there is plenty of room everywhere. We cannot say with certainty whether the universal use of a reliable contraceptive would increase or decrease the population, but we can rely on a **much healthier race** in a few decades (quite apart from more numbers) if the rate of increase is regulated by deliberate forethought and intelligence.

The only preventative which completely meets all reasonable requirements is PATENTEX, which I both employ and recommend. It is thoroughly wholesome and effectual and easy and pleasant to use. It gives protection from pregnancy for several hours after use. The albuminous protoplasm is liquified and thus spermatozoa and disease germs are both destroyed. I refer to the testimonials printed herewith for authoritative opinion on its anti-septic properties; moreover PATENTEX acts as a disinfectant in the case of catarrhal (and other) vaginal discharges; the jelly remains for several hours on the sore or infective portions of the mucous membrane and thus cleanses and invigorates the parts. This makes subsequent vaginal douching unnecessary. Women find Patentex pleasant to use, cleanly and comfortable. During the many years of medical practice in which I have prescribed Patentex, I have not come upon a single case in which it has failed in its purpose, or in winning the full approval of my patients. It always did what the Doctor has a right to expect from a preventative.

Our social aim in the immediate future must be the production of a sound race, healthy in mind and body. It is a sacred and fundamental duty of the medical profession, who are qualified and permitted to investigate the secrets of humanity and society, to keep weakly and unfit potential parents constantly aware of their great responsibility. Children who may hereafter bear in their bodies or characters throughout life the tragic seeds of preventable disabilities and defects, will assuredly not thank their fathers that beget them, nor their mothers that brought them to birth.

May the preventative PATENTEX be a potent instrument for the improvement of our race and the happiness of married life. May it help to solve our difficulties and stabilise a glorious and happy future for our people.

NOTE.

In reference to the testimonials about Patentex from eminent Doctors, it should be known that abroad medical men are not prohibited by professional etiquette from mentioning and recommending medicines and methods in print, as they are in England.

ON CONTRACEPTIVES.

Article by The Biologist Dr. F. F. WERNER.

If the human genital ejaculation, — which, of course, consists of the secretions of the testicles and the accessory glands — is placed in test tubes and kept at a moderate temperature, 15°—20° Cent., living spermatozoa may be observed after a lapse of 48 hours. This experiment indicates their vitality, which is of enormous practical importance. Dursen on one occasion found living spermatozoa three and a half weeks after coition. When we further recollect that spermatozoa have to penetrate the uterus in spite of the vibratory movements of the female organs which is in the opposite direction (centrifugal) — we can imagine their initial energy and mobility. Of course their vitality is to some extent dependent on the nature of their medium, as will be easily understood.

In practical tests we must take into account another factor, i.e., the exact age of the ejaculated substance. I have proved that sperms are still active till after the considerable lapse of time mentioned above, but with a little practice we can observe that their rate of motion becomes much slower and feebler.

It must be observed that when old ejaculate — such as is in circulation under the label a fresh sperm — is used in spermaticidal and contraceptive experiments — we may form quite false conclusions in this important matter.

To come to the most important part of our inquiries: What requisites should we demand from a contraceptive?

- (1) Firstly, it is obvious that such a substance should immediately and permanently neutralise freshly emitted Sperms.
- (2) Secondly, the substance should be closely adhesive to the female generative organs.
- (3) Thirdly, that it should have no toxic effects on the human organism.
- (4) Fourthly, that it retains its properties at a comparatively high temperature (possesses thermostability).

Now all these qualities are possessed by the product known to commerce as Patentex. This, circulated in metal tubes with

full directions as to use, should be applied before coition as a prophylactic.

Point 1. As regards the first requisite, I have made careful investigations proving that Patentex destroys spermatozoa a few minutes after ejaculation. Equal portions of quite fresh ejaculate and of Patentex jelly were placed on a hollow tray some inches apart. Under high microscopic power (Zeiss Objective 6, and Ocular 1) it could be clearly observed that the rapidly moving spermatozoa ceased to advance as they touched the Patentex. In several cases the experiment was repeated with the same result. Quantitatively, too, the experiment was exhaustive. The amount of human ejaculate varies biologically from 1 to 5 cubic centimetres; in one case the weight was 3.522 grammes. An equal weight of Patentex was added to the fresh fluid and the two were carefully mixed and again placed under the lens. No more living sperms could be detected.

Point 2. It is necessary here to distinguish between the natural mucous secretions and the Patentex substance. This may be done by staining with sepia saturations. I limited the lapse of the first tests to two hours after the Patentex had been inserted into the vagina. The Patentex was still plainly visible and had not been absorbed. This could be easily observed microscopically. I may also mention here that I tested the amount of Patentex which may be considered sufficient. We must understand that the test tube can only give us an approximate idea of the process, as much depends on the proper distribution of the Patentex. Too much is in any case safer than too little. 1.5 cubic centimetres would probably suffice.

Finally, Patentex has neither astringent or irritant (acid) effects on the female membranes, and the contents of the test tube, which had been exposed to temperatures varying from 5 to 40 degrees, centigrade were equally efficacious in use.

I conclude that medical practitioners' requirements of a safe contraceptive are all met by the invention of Patentex, and it only remains for me to hope that careful biological control will continue to guarantee its high standard. Every logical medical man will admit that such a contraceptive can be of the greatest service, especially in cases where abortions may be advisable to save the mother's life.

OPINION OF PROFESSOR Dr. A. JUNGHAHN

The two tubes of your Preparation "Patentex," one freshly filled and one a year old, which you sent me on the 10th inst., in their original packings, have been tested by me, both chemically and microscopically.

The Tubes contained a jelly-like substance of a pale yellowish-green tint. The Chemical Analysis of this substance proved it to contain the active ingredients specified by you. These substances were in solution. Tests with albumen and serum showed that Patentex caused the albuminous substances to coagulate. When some of the Patentex paste is brought into contact with freshly ejaculated spermatozoa, the rapid movement of these sperm cells immediately ceases, and they become coagulated—it is well known that spermatozoa contain albuminous protoplasm.

The coagulation is specially noticeable in the case of pendant drops, and is characterised by an opaque white streak. The tests were successful, both in the case of a neutral medium and of a weak alkaline solution (which latter gave the same reaction as the vaginal secretions).

In these tests there was no perceptible difference between the action of the fresh Patentex jelly and that which was already one year old.

On the basis of my tests I have therefore concluded that Patentex is able to produce coagulation of albumen which destroys spermatozoa.

(Signed) Prof. Dr. A. JUNGHAHN.

Public Laboratory for
Chemical Research,
Weimar.

Henss Str. 12
Weimar

5th January, 1920.

Experiments with albuminous solutions have proved that Patentex causes albumen to coagulate. Serum, Albumen and Globulin are deposited.

If Patentex is brought into contact with freshly ejaculated and highly mobile male spermatozoa, on a microscope slide which has been brought to blood heat, the movements of the sperms cease, and they become stagnant. This coagulation is shown by pale opaque streaks, and is specially perceptible in drops.

The tests were successful in both aqueous and weak alkaline media; the latter approximated the natural vaginal secretions.

No difference was perceived in the results with Patentex freshly made or a year old.

The effectiveness of Patentex as a coagulant of albuminous substances and a spermicide has therefore been proved.

(Signed) Dr. H. SALOMON.

SOME MEDICAL OPINIONS.

A WOMAN DOCTOR'S VIEW.

A famous Medical Woman, Dr. Anna Fischer-Dückelmann, recommends the use of Patentex to her patients, when they are desirous of applying a safe preventive against pregnancy. She especially praises the simplicity and agreeable nature of the preparation and its use, in a private report to the Inventor.

The German "Central Medical Journal" writes:—

"A NEW CONTRACEPTIVE. All considerations of reason and of human compassion command us to regard the prevention of pregnancy under certain conditions as a perfectly moral and right action. The majority of our profession have arrived to-day at the conclusions formulated years ago by Mensinga, and are ready to help married couples who seek their advice on preventive methods. There are cases when the prevention of pregnancy is not only advisable, but, from the purely medical point of view, imperative. These cases of tuberculosis, cardiac complaints, neurasthenia, etc., are known to all practitioners and it is in the interests both of the parents and of the community that the birth of defective offspring should be prevented. There is also a comparatively high percentage of pelvic malformations or imperfect development of the interior genital organs among women, and in such cases also, pregnancy is contra-indicated. Many previous births also frequently leave a woman who may be healthy but far from robust in such a state that she should not have to face a similar ordeal, — and this from the medical side only, and without touching on the ethical or economic aspects of the fundamental human problems for whose solution contraceptives offer—at least partially—a practicable means. All doctors know cases of the unreliability of the rubber check pessaries, and also of the condoms; moreover, the more expensive types of condom are impossibly expensive for the majority of people. Attempts to attain the object of contraception, by introducing soluble drugs and medicinal preparations into the female passage, appear, so far, to have met with no definite success. It is all the more interesting to realise that the medical profession is acquiring full confidence in the new preventive "Patentex". Patentex combines all chemical requisites, and is neither toxic nor irritating, but hygienically perfectly harmless. It is safe and reliable and in its application simple, comfortable and cleanly. One of its ingredients immediately neutralises the Spermatozoa; as the preparation is applied in the form of a jelly (semi-liquid) it at once dissolves the protoplasmic substance of the sperm cells, and destroys the vital principle.

Patentex is put up and sold in neat distinctive metal tubes, which should become popular, as they facilitate its use. A glass "nozzle" accompanies the metal tube, and is screwed on to its

mouthpiece and introduced upwards to the mouth of the cervix. A turn of the "key" will squeeze out the necessary quantity of jelly over the cervix, which will be protected and rendered immune for hours by this means.

The process described above is simple and tidy, it does not require much time or complicated manipulations, nor arouse distaste, and the little appliance which performs its function so unerringly will soon be a necessary item of every woman's property. The reasonable price at which PATENTEX is sold should help to popularise it rapidly and bring it into use among the poorer sections of our countrymen."

Dr. Fuchs writes to the German "Pharmacopoeical Review" as follows:—

"The chemical composition of Patentex gave ground for optimism as to its results, and the experiments made in the course of professional practice by the writer of these lines, have been very satisfactory. I have prescribed Patentex as a contraceptive and succeeded in averting pregnancy in the following cases: two tuberculous women, four women who were in a state of dangerous exhaustion owing to excessive haemorrhages caused by parturition and abortion, two syphilitics, and one woman suffering from heart disease.

I may mention that one of these cases had previously suffered from annual pregnancies, interrupted by miscarriages, and in another of the cases (tubercular) conception occurred also yearly, and the frequent gestations and births were ruining her health. Both women were very anxious about their health, and feared for the life of future children, and were happy to be able to avert what they so dreaded by using Patentex. One young woman, the wife of an artisan, who had become dangerously anaemic as a result of loss of blood, was also in dread of possible gestation, as she was very liable to conceive, in spite of infrequent intercourse and the use of the *douche*. She had had four children already. She begged urgently for a reliable preventive, and I recommended her to use Patentex until her health was somewhat restored. She used it and found it effective for six months, and on ceasing to use it was promptly impregnated again. These data prove that Patentex is a reliable, harmless preventive that does not irritate the vaginal membrane, and should be recommended by the medical profession in appropriate cases."

23 Years Trials and Triumph.

AUTHENTIC TESTIMONIALS FROM DOCTORS AND LAYMEN
of
THE EFFICACY OF PATENTEX.

These testimonials are extracted from some thousands of similar expressions of praise and thanks from Users of Patentex. This booklet in the original is stamped and officially certified by a notary, that the following copies of letters and of extracts from letters are faithful copies and correct renderings of the original.

1.

There are three essentials for a conception preventative:

It must be absolutely effective, non-injurious to health and its operation must be convenient and discreet. All these qualities are united in a most ideal manner in Patentex. Since its introduction i. e. more than 20 years ago, I have always prescribed it in my practice and I am entirely satisfied. If Patentex is used regularly in a correct manner it cannot fail to be successful.

V.

W., Dr. of Medicine.

2.

In order to convince myself of the efficiency of your preparation I have frequently used it myself and I consequently can always recommend it as absolutely safe. It is indispensable to know an effective conception preventative which may be conscientiously recommended. Patentex can perform all that we claim it does.

W.

G., Dr. of Medicine.

3.

For five years I have used your Patentex to my fullest satisfaction. I had lost all my strength. In seven years I had nine children. The poor kids nearly had no mother as I had become so very bloodless, weak and nervous that my children had to be taken away. I really feared to lose my senses. All this only in consequence of my weakness. One of my acquaintances recommended your Patentex to me. Since the five years I have been in possession of your Patentex I have put on weight. I am unhappy that of my nine children there are only three living but they all are healthy and well developed. All this and my present health, we owe to your Patentex.

M.

Mrs. J. N.

4.

I have been recommending your Patentex for some years already and I have often earned the warmest thanks for the good advice. As I am convinced myself of the absolute reliability I willingly assist every woman. I shall always recommend your Patentex to everybody.

B.

Mrs. K. T.

5.

I am married and have two children of 6 and 4 years. Since I have used Patentex we have got no more unwished for children. I have used it now for 3½ years. Formerly my wife suffered very much from the whites which have been completely cured. I consider your Patentex to be one of the best preventatives for the regimen of women. Dr. Hodann too warmly recommends Patentex in his literature, in his work „Boy and Girl“ „Mankind and Love“ and in nearly all his others works.

H.

W. M.

6.

In my opinion Patentex solves in a really ideal manner the problem of a double-effective mechanical and chemical protection. With respect to its reliability and harmlessness it really answers best all the claims so that it seems to be of the greatest importance for the extraordinarily difficult and ardent solution of the question (if I may use Dr. Sellheims words) "how to lead Nature by the nose", without having however an opportunity for revenge.

B.

Professor H.

7.

I wish to inform you that I am very well satisfied with your Patentex. It absolutely sure and since I have been using it I am healthy and happy. I have, of course, always recommended it to all my friends and they are all grateful to me.

D./Austria.

Mrs. Marie M.

8.

I have been using your Patentex for some years already and I am entirely satisfied. Owing to its absolute reliability it is to be considered the best product of that kind. As I am very much pleased with your Patentex I have always recommended it most warmly to all my friends.

B.

9.

R. D.

As I have been using your Patentex for many years I should like to ask you

I have used it now for 10 years already and as I surely can describe it now as absolutely safe I should like to recommend it to my acquaintances in Austria.

G.

10.

L. S.

I feel I must express my utmost satisfaction to you. As Patentex can be used with the conviction of a complete surety it acts as a sedative upon the nerves — my wife's and mine — and it has become indispensable to us.

E.

G. H.

11.

I have been using Patentex for seven years with best results and I can recommend it to everybody. My wife has never felt any disadvantages whatsoever.

D.

W. A.

12.

. and I must express again my warmest thanks to you for your wonderful preparation. Since the day we used Patentex we felt the utmost confidence in it. Our married life has become much happier than before as Patentex is acting as a sedative upon the nerves. We shall, of course, recommend it everywhere and I repeat expressly that Patentex is to be considered a wonderful product of important social and hygienic value.

Pl.

W. Sp.

13.

The undersigned whose wife was very liable to conceive has used Patentex to his entire satisfaction. As his economic circumstances do not permit any increase of his family against which he is now protected he feels obliged always to recommend your Patentex to all his friends and acquaintances.

Oh.

Max K.

14.

After having used your Patentex for nearly 4 years I can testify that it is a capital contraceptive. I am perfectly satisfied. Happiness and peace have entered my house again and since my wife is using Patentex she has been completely cured from nervous headaches. I am greatly interested in assisting everybody in the present economical circumstances and I feel obliged to enlighten those who, being unexperienced, still increase the number of their children in spite of their being unable to serve the interests of the state with strong and healthy citizens. I shall always recommend your Patentex everywhere. My wife wishes to express to you her warmest thanks and I too am very grateful to you for your help.

M.

K. K.

15.

I have great pleasure in informing you that for several years I have known your Patentex as the best contraceptive. I have already had recourse to some others but they all have not been so successful as Patentex. Patentex offers no disadvantages whatsoever which I cannot say of the other preventatives. In one word it is my "non plus ultra". I can therefore recommend your Patentex to everybody with a safe conscience.

St.

K. M.

16.

There is no better preventative than yours. All my acquaintances can only praise it. I have been using it for three years and I also shall recommend it in future.

E.

M. F.

17.

I have been prescribing your Patentex in suitable cases, the occurrence of which can only be denied by socially untrained

persons and I can testify that it has proved very excellent, reliable and harmless. I consider its blessings to be ever so high as I abominate the unsocial increase of births and Epidemy of abortions.

S.

Dr. B.

18.

I am very satisfied. All anxiety has vanished at last. I have recommended Patentex everywhere.

O.

Mrs. H.

19.

As I am entirely satisfied with your Patentex I have also recommended it to my acquaintances in America. They all are now desirous of getting it.

D.

Mrs. M. Sch.

20.

I have always been satisfied with your Patentex. I am using it constantly the more as our Doctor urgently advised my wife to avoid motherhood.

B.

F. K.

21.

I wish to thank you with all my heart for your Patentex. I am entirely happy and it has become indispensable to me. I have already recommended it to some friends.

Fl.

Fr. B.

22.

I am entirely satisfied with your Patentex. It is easy to use, clean and quite harmless and it has always been effective.

St.

D., Dr. of Medicine.

23.

Patentex is a safe and harmless conception preventative.

B.

K. W., Dr. of Medicine.

24.

Moreover I wish to express my warmest thanks to you. I really am astonished at the good results and I am very satisfied. All my acquaintances are delighted with Patentex.

Dr.

H. K.

25.

I have been using your Patentex for a long time and I have recommended it to all my friends as a safe contraceptive.

K.

K. Sch.

26.

I too am very satisfied as I now have been using it for two years already. I can only recommend it to everybody.

Dr.

Mrs. M. Z.

27.

I wish to inform you that we are entirely satisfied with your preparation and we shall not fail to recommend it among our friends.

B.

K. B.
