

THE PILL

How does the Pill work?

The Pill is probably the most effective and safest method of birth control available to women. It has been shown to be more effective than the condom, the diaphragm, and the cervical cap. It also has the advantage of being reversible, so that women can stop taking it at any time and still be able to get pregnant. The Pill is also very convenient, as it can be taken at any time of the day and does not require any special equipment or procedures. However, it is important to remember that the Pill does not protect against sexually transmitted diseases, so it is still important to use other forms of protection.
